

How can I make things work when they go wrong?

Word	Definition
 Instruction	How to do something
 Algorithm	Step-by-step instructions
 Repeat	To do something more than once
 Direction	The way something moves

Follow this algorithm for the Bee-Bot.

Does it reach the flower? Why not? How can you debug it to solve the problem?

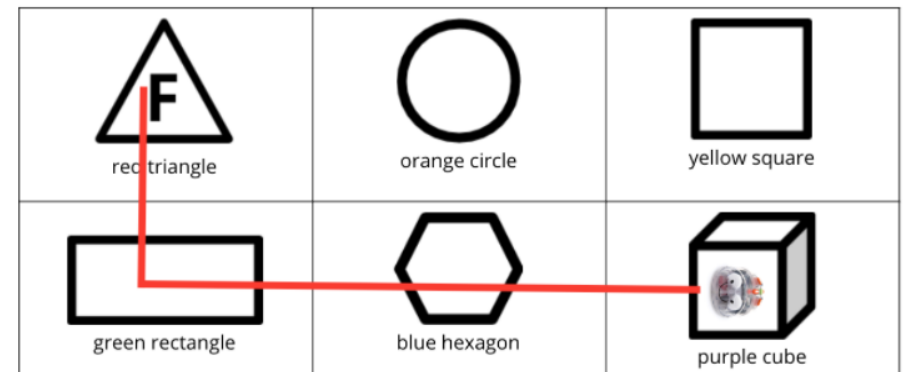

When we debug, we look at each step of the algorithm carefully so see if it is right or wrong.

If it is right, we check the next step.

If it is wrong, we change it.

Sometimes the algorithm might look slightly different.

Can you work out if the Bee-Bot makes it to the triangle correctly?

CLEAR

Did you remember to press "Clear" first? That will clear your Bee-Bot's memory and you can start again.
